1. `parser.add_argument("--model", type=str, default="baseline", choices=["baseline", "unet", "derainnet", "mymodel"], help="Model to use")`

2.创建 `model/DerainNet.py` 和 `model/Mymodel.py` ，内容先用 `model/baseline.py` 套皮占位，并在 `main.py` 中加入

```
from models.DerainNet import DerainNet
from models.Mymodel import Mymodel
```

3.

```
 if args.model == "baseline":
    model = BaselineNet().to(device)
 elif args.model == "unet":
    model = UNet().to(device)
 elif args.model == "derainnet" :
    model = DerainNet().to(device)
 elif args.model == "mymodel" :
    model = Mymodel().to(device)
```

另外，因为本部分规定**损失函数只能使用 L2 Loss** ，因此把 `pixel_loss_fn` 改为 `MSEloss`

```
# pixel_loss_fn = nn.L1Loss()
pixel_loss_fn = nn.MSELoss()
```
